Important information

Data:

- For the purpose of this task, I focused on the frontend part. As for the data used, I did not hard code any data into the react code. The data is being is imported from json files that I create and manually structured and filled with data.
- Any changes that appear on the interface from using any functionality, does not propagate into updating the json files.
- The json files are "providerData.json" and "myData.json" for "buyer-app", and "busyDates.json" is for the "provider-calendar".

Testing info:

- Since the data isn't hard coded within react and taken from json files, only dates on the calendar from 3rd to 8th of this month have data associated with them.
- All time slots are by default unavailable until marked so by the provider, and they are colored grey
- For the provider app, unavailable (grey) time slots are clickable to mark available.
- On the buyer side, grey time slots have no functionalities.

I hope you like my work!
